Order Blocks

Where the move started, and where price comes back to.

lnk.

What is an order block?

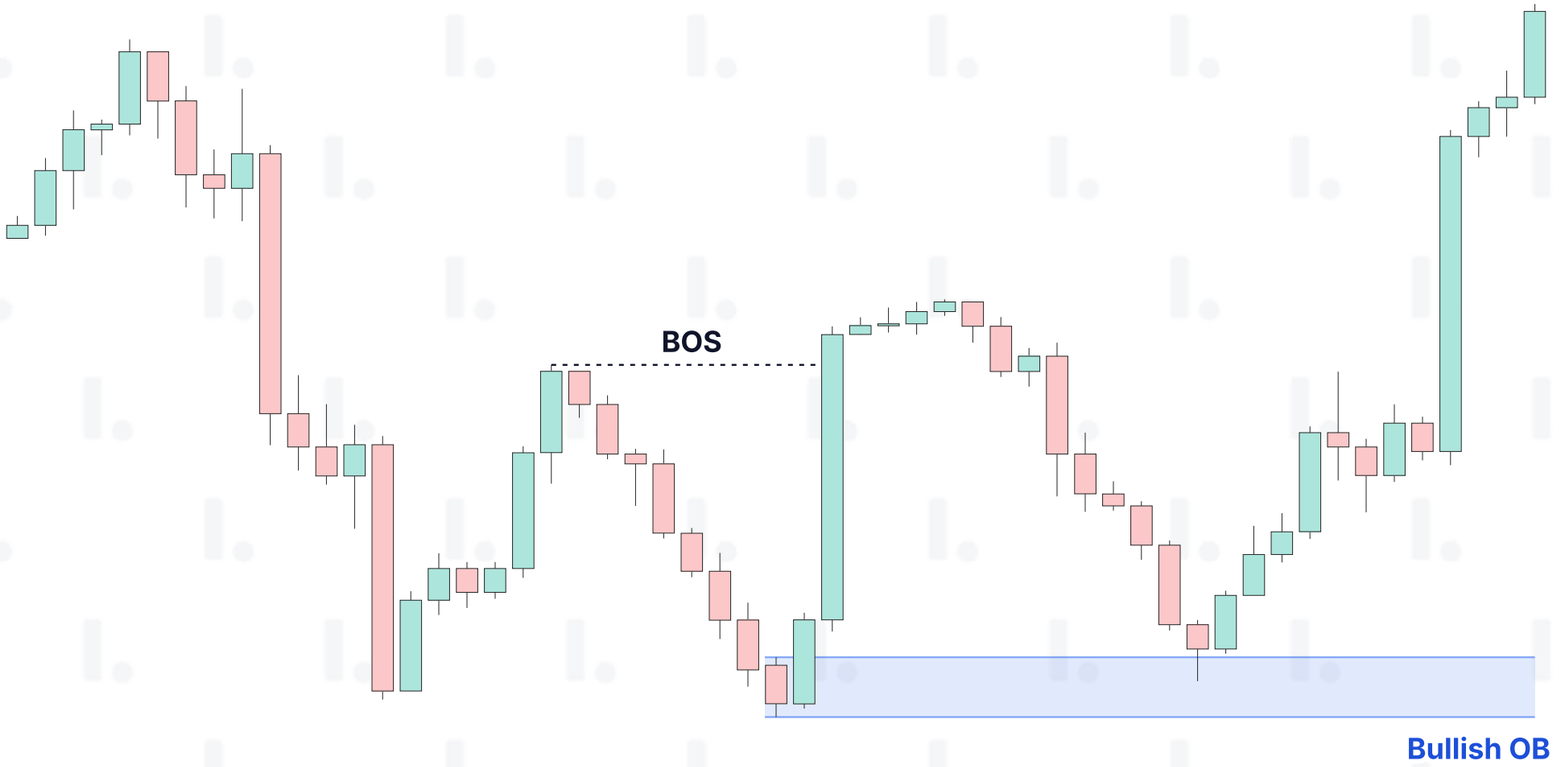

Order block the move it starts

In one line

The last opposite candle before a strong move.

Price often comes back to it before carrying on.

Bullish order block

Bullish OB

The last down candle before price breaks structure up.

Look for buys when price returns to it.

Bearish order block

Bearish OB

The last up candle before price breaks structure down.

What makes it valid

1

Takes liquidity

It sweeps an old low (or high) first.

2

Leaves an FVG

The move away is fast and leaves a gap.

3

Breaks structure

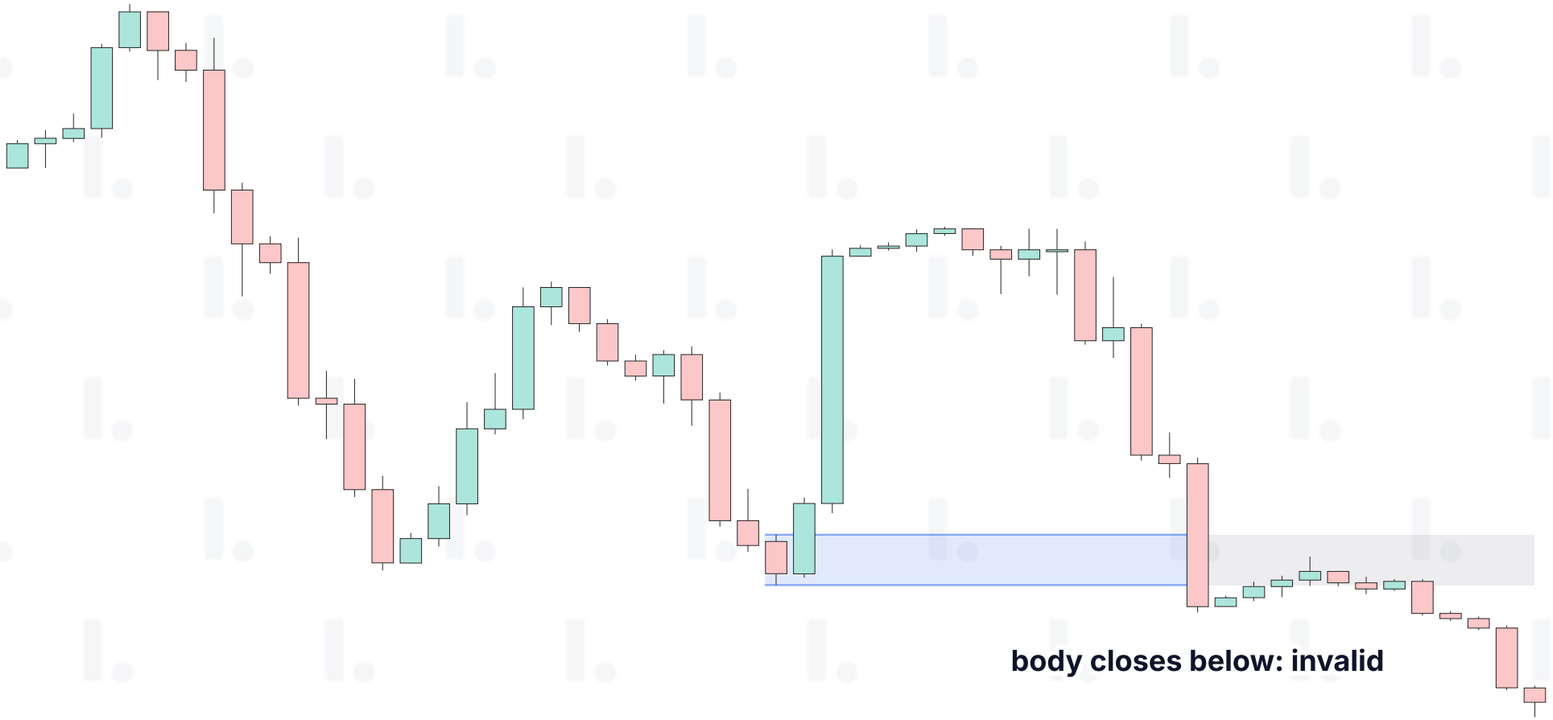

The move closes past the last swing.

4

Entry

Top of the OB or its 50% line. Stop below the OB low.

When it fails

Step aside

A candle body closing through the OB means it did not hold.

Wait for the next set-up.
